

PISA Designed to provide power and data facilities to clustered workstations from a central point.

Port

Complementing and based on **Prism**, **Port** is designed to allow easy access to under desk power and data cables and connections. This is ideal where a 'permanent' cable installation needs to be easily reached for servicing and expansion.

Port may also be used as a blank to replace a relocated **Prism** or to allow for future **Prism** installations.

DataBox

An elegant solution for networking applications, **DataBox** is constructed in the same alloy extrusion as **PowerBox** therefore complementing the power modules.

A four aperture fascia allows high densities of 6c outlets. Extending the length of the extrusion allows networking connector bars to be created.

Earthing

Earth leads can be supplied with lengths and terminations to suit any application. Earthing kits to include all nuts, screws and washers can be packaged to specification. If help is required with developing earthing kits, to enable compliance with BS6396 **Office Electrics**' technical staff will be pleased to advise.
